

International Workshop

A main challenge facing industry today is the societal demand for innovations which are safe, ethically acceptable, addressing societal demands and values. Understanding users' needs, attitudes and expectations is paramount to ensuring the success of innovative products and services and to fostering **Responsible Research and Innovation (RRI)**.

Over the past year, the **Responsible Industry Project** has undertaken an in-depth analysis and consultation of stakeholders in Europe and worldwide aimed at identifying the critical elements that should be addressed to pursue RRI, focusing on Information and Communication Technologies (ICT) and Services for an ageing society.

What are the principles, methodologies and governance tools that can help industry to attain the RRI goals?

What are the experiences of industry and other stakeholders regarding RRI practices?

We would like to invite you to participate in this first dialogue initiative of the project. A draft Implementation Plan will be presented indicating how industry can work together with societal actors to integrate RRI into the research and innovation process.

The event aims to

- Present the Responsible Industry project
- Illustrate the results of the stakeholders' consultation
- Foster a dialogue on stakeholders' principles, values and perspectives for RRI
- Discuss the draft Implementation Plan in ICT for an ageing society

Participating in the workshop will give interested parties a first-hand opportunity to contribute to the design of the Implementation Plan.

Who should attend

Industry, policy makers, regulators, researchers, Civil Society Organizations and those active or interested in RRI and ICT for an ageing society.

Registration

Attendance is free, but registration required (click here to register)

International Workshop

Responsible Research and Innovation in industrial practice: the case of ICT for an ageing society

Karlsruhe Institute of Technology, May 21st, 2015
